

Draft checklist of the trees of the northern Republic of Congo

Royal Botanic Garden Edinburgh, 20A Inverleith Row, Edinburgh EH3 5LR, U.K.

INTRODUCTION

This checklist is part of an ongoing project to improve the taxonomic tools available for forest inventory and conservation in the northern Republic of Congo. It specifically relates to the area centred on Nouabalé-Ndoki National Park, and includes information which will be relevant to the contiguous forest in Cameroon (Lobéké) and the Central African Republic (Dzanga-Sangha).

This checklist is limited to forest trees and strangler figs reaching a mature diameter at breast height (dbh) of at least 10 cm. It also includes some species which are smaller than this but are often confused with larger trees in the list. It is presented as a list of species, arranged alphabetically by family, genus and species. Each entry comprises:

- Species name and authority,
- Any selected synonyms,
- A reference to the work used to identify specimens of this species,
- Habitat notes, and
- Conservation status where known, taken from the IUCN Red List (IUCN, 2006).

The habitats covered include (see Harris, 2002 for a more detailed description of these types):

- Mixed species *terra firma* forest, the most widespread and diverse vegetation type in the area,
- *Gilbertiodendron dewevrei* forest, dominated by that species and different in both species composition and structure from the previous type,
- Riparian forest, alongside rivers and streams, and intergrading with swamps and seasonally flooded forest,
- Seasonally flooded forest, inundated by annual flooding from the Sangha River, and
- Seasonally flooded sedge meadows, in forest clearings alongside streams.

At present the checklist contains 468 species in 248 genera and 55 families. The largest family is Leguminosae (36 species), followed by Rubiaceae (27) and Euphorbiaceae (26). The largest genera are *Drypetes* (Euphorbiaceae) & *Ficus* (Moraceae; each with 17 species), followed by *Xylopia* (Annonaceae; 11 species).

Only forty (8%) of the species in the checklist have been assessed for conservation status; of these one (the valuable timber tree *Autranella congolensis*, Sapotaceae) is categorised as “Critically Endangered”, three as “Endangered” and 24 as “Vulnerable” (the remainder are “Low Risk”). Meliaceae contains the greatest number of threatened species in the area (eight). From this we conclude there is an urgent need to establish the conservation status of the remainder of the trees in this area, in order to facilitate management strategies for the increased protection of threatened tree species.
